Censo App Security Review Update

New security issues, 0

After the development team implemented the latest updates, FYEO conducted a review of the modifications. The primary goal of this evaluation was to ensure the continued robustness of the app's security features, safeguarding user data and maintaining the overall integrity of the applications.

General Updates:

The iOS modifications introduce labels for seed phrase owners, so that those people helping secure them can understand who is who. Changes have been made to the UI and some functionality was moved to a settings screen, which also shows the user which people they are helping secure their seed phrases.

For Android, improvements to the UI and navigation have been made, error handling and messages have been improved. The recovery screen has been added allowing users to restore their seed phrases from shards.

These changes do not introduce any vulnerabilities or compromise the security posture of the Censo apps.

Specific Security Changes:

No security specific issues were identified in the reviewed code.

Commit Hash Reference:

For transparency and reference, the security review was conducted on the specific commit hashes for both the iOS and Android repositories. The commit hashes for the reviewed versions are as follows:

iOS: d270f55ecebb52e4c6b2eff7c0c9344cf029eb20
Android: 6fc080ac54a46a3ae0ace3b6ba91053aa1d2c822

Conclusion:

In conclusion, the security aspects of both Censo apps remain robust and unaffected by the recent updates. Users can confidently interact with the application, assured that their seed phrases and stored data are well-protected. The commitment to security exhibited by the development team is commendable, and we appreciate the ongoing efforts to prioritize the safeguarding of user information.
